

6.2_Closure

A network can be defined as the connection of two or more computer systems which allows them to exchange data.

There are a number of different ways in which users can connect to the internet.

Various hardware devices are needed to make a network function properly.

To make effective use of the physical infrastructure of networks, computers need clear standards for communication.

A network backbone is a network which contains high-capacity connectivity infrastructure that links lower-capacity parts of the network.
